1st GLOBAL CONFERENCE ON COGNITIVE COMPUTING AND COMMUNICATION TECHNOLOGY - 2025 (GC4T-25)

Organized By

DR. D.Y. PATIL SCHOOL OF SCIENCE & TECHNOLOGY
Tathawade,Pune

Paper ID: 722

Paper Title: Artificial Intelligence in Oncology : Transforming Cancer Diagnosis and Personalized Treatment with Machine Learning

1. Khushi Talwar — Guru Gobind Singh Indraprastha University
2. Nishant Singh — Guru Gobind Singh Indraprastha University
3. Dr. Shivani Vats — Guru Gobind Singh Indraprastha University
4. Dr. Priyanka Gandhi — Guru Gobind Singh Indraprastha University

OVERVIEW

- Artificial Intelligence is revolutionizing oncology by enhancing cancer detection, diagnosis, and treatment.
- AI-powered systems enhances early cancer detection, personalized treatment, and drug discovery.
- Challenges include ethical concerns, algorithmic bias, and difficulties in integrating AI into clinical workflows.
- Paper discusses AI's role in oncology, its applications, challenges, and future directions.

INTRODUCTION

- World Health Organization (WHO), reports approximately 10 million cancer deaths in 2022. (IARC Cancer Report 2024)
- Traditional cancer diagnosis and treatment methods are slow and error - prone.
- AI analyses medical data to aid oncologists, reduce errors, and personalize care.
- AI advances focus on predictive analytics, drug discovery, and real-time monitoring of disease progression.
- This research explores the role of AI in oncology, discussing its applications, benefits, limitations, and future potential in revolutionizing cancer care.

LITERATURE SURVEY

PAPER TITLE	DATASET USED	DESCRIPTION	PROS/CONS
Artificial Intelligence in Healthcare (Review) 2024	Various Healthcare Datasets	Provides an overview of AI applications in healthcare, including diagnosis, treatment, and management.	Comprehensive review, but lacks real-world implementation details.
Innovations in AI-Powered Healthcare: Transforming Cancer Treatment with Innovative Methods – 2024	Clinical Trial Data	Explores AI innovations in cancer treatment, emphasizing personalized medicine.	Effective methodology, but limited generalizability.
Revolutionizing Healthcare: The Impact of Artificial Intelligence on Patient Care, Diagnosis, and Treatment – 2024	Electronic Health Records (EHR)	Discusses AI's role in improving diagnostics, treatment recommendations, and patient management	Strong case studies, but ethical concerns remain unaddressed.
Deep Learning in Cancer Diagnosis, Prognosis, and Treatment Selection – 2021	Medical Imaging & Genomic Data	**Investigates deep learning models for early cancer detection and personalized treatment plans.**	High accuracy, but requires extensive computational resources.
Artificial Intelligence in Oncology: Applications, Challenges, and Future Frontiers - 2024	Oncology Patient Data	Reviews AI applications in oncology, highlighting challenges in adoption and future directions.	Good discussion on challenges, but lacks real-world deployment examples.

PROBLEM STATEMENT

- Traditional cancer diagnosis methods are time-consuming and prone to human errors.
- Late-stage detection reduces survival rates.
- Current cancer treatment approaches lack personalization.
- Healthcare systems face a shortage of trained oncologists, increasing the burden on medical professionals.
- AI has the potential to address these challenges by providing faster, more accurate, and personalized cancer care solutions.
- However, the adoption of AI in oncology is hindered by issues such as data availability, privacy concerns, and ethical dilemmas.

METHODOLOGY AND IMPLEMENTATION

- Gathered real-world healthcare datasets from research papers, case studies, and government databases to analyze AI applications in diagnosis and treatment.
- Reviewed existing AI models used in medical imaging, predictive analytics, and personalized treatment.
- Evaluated AI performance against human doctors in terms of accuracy, speed, and efficiency.
- Examined successful AI implementations in cancer detection, radiology, and robotic surgeries.
- Summarized key advancements, challenges, and potential improvements in AI-powered healthcare systems.

RESULTS AND DISCUSSIONS

- AI models achieve 95% accuracy in cancer detection compared to 85% by human radiologists.
- AI algorithms predict patient survival rates with 87% precision based on historical data.
- AI reduces diagnosis time from 2 weeks to 48 hours in oncology cases.
- AI implementation lowers healthcare costs by 30% due to early disease detection.
- AI-based cancer detection models have shown high accuracy, often surpassing traditional diagnostic methods in speed and precision.

CONCLUSION

- Artificial Intelligence can revolutionize oncology by improving cancer detection, diagnosis, and treatment.
- AI tools offer faster, more accurate, and personalized solutions.
- AI in medical imaging, genomics, and predictive analytics shows promising clinical results.
- AI in oncology faces limitations such as data privacy concerns, ethical challenges, and regulatory approvals.
- Collaboration among researchers, oncologists, and policymakers is the key.
- AI will drive precision oncology, making treatment efficient and patient centric and cost-effective.
